

Kickstar Product Requirements Document

Track: Superteam Earn — TxODDS World Cup Hackathon, Consumer & Fan Experiences
Submission deadline: July 19, 2026 ·

1. Problem Statement

Every major football app SofaScore, FotMob, Flashscore, Socios, FPL — is built on the assumption that the user can read fluently and interpret stat tables. That assumption excludes a huge population of passionate football fans, particularly across Nigeria and much of Africa, where low reading comfort (not low football knowledge, not low smartphone ownership) is the actual barrier to using these products.

Kickstar is a football companion app designed around **sight, sound, and touch**, not text. Nothing in the core experience requires reading to understand what to do or what's happening in a match. Fan identity, participation, and rewards are built on Solana so they're permanent, portable, and can't be reset or faked.

2. Goals

Goal	Why it matters
Prove a football app can work with zero mandatory reading	Core thesis of the product; must be demonstrable in the demo
Ship a visually distinctive, emotionally engaging fan identity system	This is the differentiator vs. every existing sports app
Demonstrate real-time TxODDS data turned into voice/icon explanations	Shows the "Why Engine" isn't a gimmick — it's live and functional

Keep scope solo-buildable in the hackathon window

Ryder is building solo; over-scoping kills the submission

Design for post-tournament survival, not just demo day

Judges reward products with a life beyond the World Cup

Non-goals (explicitly out of scope for this PRD)

- Real-money wagering or odds-based betting of any kind (TxODDS data is used for stat validation and match context only)
 - Full multi-league coverage at launch
 - Native iOS/Android builds for the hackathon (web-first, mobile-responsive)
-

3. Target User

Primary persona: "Chidi," 24, Port Harcourt. Follows football obsessively — knows every player on his club, argues about tactics with friends — but doesn't read comfortably in English and finds stat-heavy apps intimidating and slow. He uses WhatsApp voice notes constantly and taps through apps by icon recognition, not text scanning. He wants to feel like a real fan with something to show for his knowledge, not a spectator staring at numbers he can't parse.

Secondary persona: Fans who *can* read fine but are burned out on dense stat tables and want a faster, more visual, more social way to follow a match — the "advanced mode" toggle exists for them.

4. Core Philosophy (Design Constraints)

These are non-negotiable filters every feature must pass before it's built:

1. If a feature needs reading to function, it gets redesigned before it gets built.
 2. Every core action is completable through sight, sound, or touch alone.
 3. No multi-step forms, anywhere, ever, in onboarding or core flows.
 4. One-tap actions only for core interactions — no nested menus for primary tasks.
 5. Advanced/detailed-stats mode is opt-in, never default.
-

5. MVP Scope (Hackathon Build by July 19)

Everything below is chosen because it's (a) solo-buildable in the time available, (b) visually demoable in under 3 minutes, and (c) proves the core differentiators — accessibility, fan identity, and AI explanation.

P0 — Must ship

Feature	Description	Notes
Icon-based onboarding	Tap club badge / player photo to set up profile — zero text input	No forms; matches "no typing anywhere" rule
Fan Pass (cNFT)	Compressed NFT minted on Solana representing fan identity; visual badge/trophy display, not a stat table	Core differentiator — must be on-chain and visibly demoed
Tap-to-predict micro-challenges	Predict next goal/card/corner by tapping team badges or player photos	Core participation loop
Why Engine (voice)	TxODDS live event → simplified Pidgin explanation via Abena AI TTS, triggered by one-tap "why" button	Uses nigerian_pidgin_p / nigerian_pidgin_s voice IDs
Icon/emoji momentum + alert indicators	Visual momentum meter, color-coded goal/red-card alerts	No reading required to understand match state

XP + visual reward reveals	Animated reveal on completing predictions/challenges, not a text toast	Reinforces non-gambling framing
----------------------------------	--	------------------------------------

P1 — Build if time allows

Feature	Description
Shareable commentary cards	Satori-rendered cards from Why Engine output, branded in Kickstar design system, shareable to WhatsApp/Twitter
Match Rooms (lightweight)	Emoji reactions between 2–4 friends on the same match, no chat/text required
Advanced mode toggle	Reveals underlying stat table for users who want it

P2 — Explicitly post-hackathon

- Decision Mode (tactical guess vs. reality comparison)
- Second Screen Mode (pressure meter synced to live TV)
- Full Match Rooms with voice notes
- Sponsor-backed perks / merch redemption
- Multi-tournament/league portability of Fan Pass

6. Feature Requirements (Detail)

6.1 Fan Identity — Fan Pass

- Minted as a Solana compressed NFT (cNFT) at onboarding; upgrades/evolves visually as the fan accumulates achievements (not replaced — same asset, updated metadata/traits).

- Tracks: matches watched, prediction accuracy %, clubs followed, streaks, badges/trophies earned.
- Display is entirely visual — badge shelf, trophy case, streak flame — never a raw stats grid by default.
- Must be portable in architecture (not hardcoded to World Cup event data) even if only single-tournament data populates it during the hackathon.

Acceptance criteria: A user can complete onboarding, see their Fan Pass minted on-chain, and view it as a visual badge/trophy screen with zero typed input at any point.

6.2 Why Engine

- Input: TxODDS SSE event stream (live match events + stat-validation endpoint).
- Pipeline: TxODDS event → Pidgin text generation → Abena AI TTS (nigerian_pidgin_p/s voice IDs) → audio playback on one-tap "why" button.
- Visual layer: icon/emoji indicators for momentum, danger, calm moments, updated in near-real-time alongside voice availability.

Acceptance criteria: During a live or simulated match feed, tapping "why" on any moment produces a spoken Pidgin explanation within an acceptable latency window (target: under 3 seconds from tap to audio start for the demo).

6.3 Tap-to-Predict

- Predictions selected via team badge or player photo tap — no dropdowns, no typed scorelines.
- Micro-challenges scoped to short windows (next corner, next card, next sub) so predictions resolve quickly and keep engagement tight during the match.
- Resolution and XP reward delivered as an animated visual reveal.

Acceptance criteria: A user can make and receive resolution on a prediction using only taps, with no text entry at any step.

6.4 Rewards

- XP accrual tied to participation (predictions made, challenges completed), not outcome-only, so low-accuracy users still feel progression.
- Explicitly non-gambling: no monetary stakes, no withdrawal mechanic, framed entirely as identity/collectible progression.
- Reveals are visual/animated, not text notifications.

7. Non-Functional Requirements

Requirement	Target
Accessibility	Every core flow completable via sight/sound/touch alone; screen-reader-friendly icon labeling as a fallback layer
Latency (Why Engine)	Voice response within ~3s of event for demo credibility
On-chain cost	cNFT minting must stay cheap enough for solo-funded testnet/mainnet demo (compressed NFTs chosen specifically for this)
Design system	Kickstar palette + typography, applied consistently across all screens (see Section 7.1)
Platform	Mobile-first responsive web for hackathon; native app is post-hackathon roadmap

7.1 Kickstar Design System

Brand identity

- Primary Purple **#9945FF** — brand/logo/focus states
- Solana Green **#14F195** — wallet actions, blockchain success states
- Gradient (purple → green) — reserved for premium onboarding and achievement moments

Backgrounds & surfaces

- Background **#15111F** · Surface **#1F1A2E** · Elevated **#2A243C** · Card **#312B47** · Divider **#40365C**
- Dark layering creates depth and reduces eye strain during extended match viewing

Typography — **#F8F7FC** (primary) / **#B5AFC8** (secondary) / **#6E6782** (disabled) / **#15111F** (inverse)

Primary actions

- Gold #FFB627 — main CTA buttons (single dominant CTA color, per design principles below)
- Secondary buttons: #2E2740 background with white text
- Ghost buttons: purple text only, no fill

Match status colors — Live #22C55E · Upcoming #3B82F6 · Finished #8B8B9E · Postponed #F97316 · Cancelled #EF4444

Football event colors — Goal (green) · Yellow Card #FACC15 · Red Card #EF4444 · Penalty (yellow) · VAR #8B5CF6 · Injury (orange)

Prediction outcomes — Win (green) · Draw (gray) · Loss (red)

Rewards — XP Gold #FFB627 · Coins #FCD34D · Gems #38BDF8 · Legendary tier: gradient purple → green

AI Companion (Why Engine) — Purple accents #7C5CFF and #A78BFA, distinct from CTA gold so AI-driven explanations read as their own layer rather than competing with action buttons

Borders — Default #342C49 · Focus #9945FF · Selected #14F195

Navigation — Background #1A1528 · Selected icon gold · Unselected #6E6782

Design principles

1. One dominant CTA color only (gold) — never split primary action emphasis across colors
2. Gradients reserved for special moments (onboarding, achievements) — not decorative default use
3. No more than 3 accent colors on any single screen
4. Semantic color meaning stays consistent app-wide (e.g., green always = success/live/win, never repurposed)

Typography system

Typeface	Role	When to use
Baloo 2, Bold (700)	Display	Live scores, countdowns, XP, rankings, reward totals, streaks, timers

Nunito Sans, ExtraBold (800)	Screen titles	High-level screen headers
Nunito Sans, Bold/SemiBold (700/600)	Headings, buttons, team names	Interface structure
Nunito Sans, Regular (400)	Body, captions, labels	All running text

Baloo 2 is reserved strictly for high-impact numeric/status moments — its rounded terminals and generous counters make numbers easy to recognize at a glance, which directly supports the low-literacy accessibility goal. It is never used for paragraphs, menus, forms, or long headlines, where it would weaken hierarchy and readability. Nunito Sans carries everything else: its high x-height and open letterforms are chosen specifically for legibility on small mobile screens and across languages, which matters given the Pidgin-first voice layer sits alongside this visual system. Both are open-source Google Fonts, keeping the type stack free to scale and simple to implement without licensing overhead.

8. Technical Architecture (High-Level)

- TxODDS API (live events + stat-validation)
- |
- ▼
- Event Processor (SSE listener)
- |
- | —▶ Pidgin text generator —▶ Abena AI TTS —▶ Why Engine audio
- |
- | —▶ Icon/momentum state —▶ Match UI (icon layer)
- |
- | —▶ Prediction resolution engine —▶ XP/reward reveal
- |
- Solana program (cNFT) ◀— Onboarding + achievement events — Fan Pass state
-
- **Frontend:** Mobile-first responsive web, Kickstar design system, icon-driven navigation.

- **Voice pipeline:** TxODDS SSE → Pidgin text → Abena AI TTS (as already scoped in prior build docs).
 - **On-chain:** Solana compressed NFTs for Fan Pass, minted/updated via program calls at onboarding and milestone events.
 - **Card rendering:** Satori for shareable commentary cards (P1).
-

9. Success Metrics

For the hackathon demo:

- End-to-end flow (onboarding → Fan Pass mint → prediction → Why Engine explanation → reward reveal) runs live in under 3 minutes with zero typed input.
- Judges can clearly articulate the differentiator (identity + accessibility + AI explanation) without it being explained to them twice.

Post-tournament (roadmap-level, for narrative in submission):

- Fan Pass retention/reuse across a second tournament or league (portability proof).
 - Prediction participation rate per active match.
 - Growth in fan reputation data as a defensible moat over time.
-

10. Risks & Open Questions

Risk	Mitigation
Solo build timeline is tight (4 days)	MVP scope is deliberately minimal; P1/P2 cut without damaging core demo
Live TxODDS data may not align with demo match timing	Have a recorded/simulated event feed as fallback for the demo

Voice latency under real network conditions

Pre-cache common Pidgin phrase patterns where possible; test under realistic mobile network conditions, not just local

"Non-gambling" framing must be airtight

No stakes, no odds display to the user, no monetary withdrawal — enforced at both product and messaging level throughout submission materials

cNFT minting cost/complexity on demo day

Test mint flow well ahead of submission, have a fallback recorded transaction if live minting is flaky during judging

Open questions to resolve before build starts:

- Which specific TxODDS event types are guaranteed available during the demo window (need to confirm against the corrected API docs already in hand)?
- Is a single demo match sufficient, or should the Fan Pass show pre-seeded historical data to demonstrate portability without needing multiple live tournaments?

11. Appendix — What We Deliberately Avoid

- No mandatory typing anywhere in the core experience
- No dense stat tables as a default view
- No multi-step forms
- No feature that requires reading before understanding what to do
-
